INDEX

1. MTBF; Calculated Value of MTBF	R - 1
2. Component Derating	R - 2
3. Temperature Rise	R - 4
4. Elec. Capacitor Computed Life	R - 5
5. Abnormal Test	R - 6
6. Vibration Test	R - 8
7. Noise simulate test	R - 9
8. Electro-static Discharge Test	R - 10
9. Impulse test	R - 11

The above data are typical values. As all units have the same characteristics, the data to be considered as ability values.

1. Method of calculation:

This calculation is by 'components count method' laid down by the DC Stabilized Power Supplies (Switching mode) committee of EIAJ.

The MTBF is determined by means of a fixed component failure rate λ_c given to each component and the number of component count of each type of component. λ_c is determined based on MIL-HDBK-217D.

Please refer to EIAJ handbook no. RCF-9021 for formula:

$$MTBF = \frac{1}{\lambda_{equip}} = \frac{1}{\sum_{i=1}^n Ni(\lambda_c)_i} \times 10^6 \text{ (Hrs)}$$

λ_{equip} = Total equipment failure rate (failures / 10^6 hrs)

λ_c = Failure rate of the i^{th} component

Ni = Number of i^{th} component

n = Number of categories of component

2. MTBF Value:

Conditions: Nominal line, rated load

Ambient Temperature 25 C °

MTBF = 130,000 hrs

2. COMPONENT DERATING

MODEL : NND15-1212

(1) calculation method:

conditions:

Input: 100VAC Output: +/-12V 0.75A (100%)

Ambient temperature : 50° C

Mounting Method : Standard

(b) Semiconductor

Compared with maximum junction temperature and actual one which is calculated based on ambient temperature, power dissipation and thermal impedance.

(c) IC, Resistors, Capacitors, etc.

Ambient temperature, operating conditions, power dissipation and so on are within derating criteria.

(d) Calculating criteria:

$$\Theta_{j-c} = \frac{T_{j(max)} - T_c}{P_c(max)} \quad \Theta_{j-a} = \frac{T_{j(max)} - T_a}{P_c(max)}$$

T_c : Case Temperature at Start Point of derating ; 25° C in general

T_a : Ambient Temperature at Start Point of Derating ; 25° C in general

$P_c(max)$: Maximum Power Dissipation

$T_{j(max)}$: Maximum Junction Temperature

Θ_{j-c} : Thermal Impedance between Junction and Case

Θ_{j-a} : Thermal Impedance between Junction and Air

6. VIBRATION TEST

MODEL: NND15-1212

(1) Vibration test class:

Frequency variable endurance test

(2) Equipment used:

Controller: SHIN-NIPPON SOKKI CO.LTD F-400-BM-E4M

Vibrator : 905 - FN

(3) Testing method:

Sweep frequency : 10 ~ 55Hz

Sweep time: 1min

Acceleration: const. (2G)

Direction: X, Y, Z.

Test time: 1H each

ELECTRO - STATIC DISCHARGE TEST

MODEL : NND 15

NND 15

(1) Equipment used

ESS - 630A (Noise Laboratory Co. Ltd.)

Discharge resistance : 330 OHM Capacity : 150 pF

(2) Measuring Conditions

Input voltage : Rated (100 VAC)

Output voltage : Rated

Output current : Rated

Ambient temperature : 25°C

Test voltage : $\pm 3KV, \pm 5KV, \pm 10KV, \pm 15KV$

(3) Testing Method

Check if there is no abnormal output when the testing voltage is applied to operating D.U.T. (Device Under Test) on its case, input terminal, output terminal, FG terminal and ACG terminal - which are parts exposed to the human body. Testing cycle is at positive, negative polarity for three times each, and the applied voltage is to be gradually increased from 3KV to 15KV.

(4) Acceptable Conditions

1. Not to be broken
2. Output not to be shut down
3. No other out of order conditions

(5) Results

OK NG
