

# EMC TEST REPORT

For The DC Power Supply

Model: CPFE1000Fi Series

Prepared for:

TDK-Lambda Americas Inc  
3055 Del Sol Blvd  
San Diego, CA 92154

Testing performed per the following:

EMC Directive 2004/108/EC
------------------------------

PREPARED ON JULY 19, 2013

REPORT NUMBER: 2013 07236803 EMC

PROJECT NUMBER: 236803

NEX NUMBER: 236803

## TABLE OF CONTENTS

-	July 19, 2013	Prepared By: <b>Danny Long</b>
-	July 19, 2013	Initial Release: Mike Krumweide

NOTE: Nemko USA, Inc. hereby makes the following statements so as to conform to the Subclause 5.10 Requirements of ISO/IEC 17025 "General Criteria For the Competence Of Testing and Calibration Laboratories":

- o The unit described in this report was received at Nemko USA, Inc.'s facilities on May 17, 2013.
- o Testing was performed on the unit described in this report on May 17, 2013 to July 19, 2013.
- o The Test Results reported herein apply only to the Unit actually tested, and to substantially identical Units.
- o This report does not imply the endorsement of the Federal Communications Commission (FCC), NVLAP or any other government agency.

This Report is the property of Nemko USA, Inc., and shall not be reproduced, except in full, without prior written approval of Nemko USA, Inc. However, all ownership rights are hereby returned unconditionally to TDK-Lambda Americas Inc and approval is hereby granted to TDK-Lambda Americas Inc and its employees and agents to reproduce all or part of this report for any legitimate business purpose without further reference to Nemko USA, Inc.

## CERTIFICATION

The compatibility testing and this report have been prepared by Nemko USA, Inc., an independent electromagnetic compatibility consulting and test laboratory.

Testing and data collection were accomplished in accordance with the test methods listed in this report.

I certify the data evaluation and equipment configuration herein to be a true and accurate representation of the sample's test characteristics, as of the test date(s), and for the design of the test sample utilized to compile this report.

## 1. ADMINISTRATIVE DATA AND TEST SUMMARY

### 1.1. Administrative Data

CLIENT: TDK-Lambda Americas Inc  
3055 Del Sol Blvd  
San Diego, CA 92154  
619-628-2890

CONTACT: Kenneth Rose  
E-Mail: Kenneth.rose@us.tdk-lambda.com

DATE (S) OF TEST: May 17, 2013 to July 19, 2013.

EQUIPMENT UNDER TEST (EUT): DC Power Supply

MODEL: CPFE1000Fi Series (see configuration details)  
(CPFE1000Fi-12, CPFE1000Fi-28, CPFE1000Fi-48)

SERIAL NUMBER: N/A (see configuration details)

SOFTWARE REVISION: NO software & revision

HIGHEST FREQUENCY GENERATED OR USED: 8 MHz

CONDITION UPON RECEIPT: Suitable for Test

TEST SPECIFICATION: Radio Frequency Emissions in accordance with requirements of  
EN 55022: 2010+AC: 2011 and FCC Part 15B.

Electromagnetic Immunity tests in accordance with requirements  
of EN 55024: 2010 and manufacturers test requirements

## 1.2. Test Plan

### Emissions:

EN55022 (Radiated & Conducted Emissions) - level B conducted and Level A radiated.

### Immunity: Test at 230VAC

EN 61000-4-2 (ESD Immunity) - Contact level 2, Air Discharge level 3. Per Criteria B

EN61000-4-3 (RF Immunity) - Level 3; 10V/m; Per Criteria A

EN61000-4-4 (EFT) - Level 3; Power line Pulses of +/-2KV;l/O Line Pulses of+/-1KV; Per Criteria A

EN61000-4-5 (Surge) - Level 3; +/- 2KV CM Surges,+/- 1KV DM Surges; Per Criteria

EN61000-4-6 (RF Immunity) - Level 3; 10Vrms; Per Criteria A

EN 61000-4-8 (Magnetic Field Immunity) - Level 4. Per Criteria A

EN61000-4-11(Voltage Dips and Interrupts) - 30% 10 ms,Per Criteria A, 60% 100ms, Per Criteria B,100% 5000ms, Per Criteria B- Testing to be conducted at input voltage of 120V.)

EN 61000-4-12 (Ringwave) - Level 3 ( $\pm$  2kV common mode,  $\pm$  1kV differential mode). Per Criteria A

EN 61000-4-14 (Voltage Fluctuation Immunity) - Level 3. Per Criteria A

Voltage Fluctuation Immunity	EN 61000-4-14: 2009	Electromagnetic Compatibility—Testing and measurement techniques - Voltage Fluctuation immunity tests

## 1.6. Test Summary

### 1.6.1. Emissions Test Summary

The Compliance Status is a judgment based on the calculated highest emissions to appropriate standard limits. Measurement uncertainty values, provided on calibration certificates, were not be used in the judgment of the final status of compliance.

Test Methods	Frequency Range	Compliance Status
EN 55022: 2010+AC: 2011, Class "B" Conducted Emissions	0.15 MHz – 30 MHz	PASS
EN 55022: 2010+AC: 2011, Class "B" Telecom Conducted Emissions	0.15 MHz – 30 MHz	Or No telecom ports
EN 55022: 2010+AC: 2011, Class "A" Radiated Emissions	30 MHz – 1000 MHz	PASS
EN 55022: 2010+AC: 2011, Class "A" Radiated Emissions	30 MHz – 1000 MHz	PASS

EMC Supervisor:

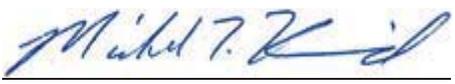

Michael T. Krumweide, Nemko USA, Inc.

IEC 61000-4-12: 2006 - Ring Wave Immunity	<b>Criterion B</b> ±0.5kV, ±1kV, ±2kV, 4kV, common mode surges. ±0.25kV, ±0.5kV, ±1kV, ±2kV, differential mode surges	<b>Criterion B</b> ±1kV, ±2kV, common mode surges. ±0.5kV, ±1kV, differential mode surges	<b>PASS</b>
EN 61000-4-14 Voltage Fluctuation Immunity	<b>Criterion A</b> Level 3 $\Delta U=12\% U_n$	<b>Criterion A</b> Level 3 $\Delta U=12\% U_n$	<b>PASS</b>

EMC Supervisor:   
 Michael T. Krumweide, Nemko USA, Inc.

Refer to the test results section for further details.

## 2. SYSTEM CONFIGURATION

### 2.1. System Components and Power Cables

DEVICE	MANUFACTURER MODEL # SERIAL #	POWER CABLE
EUT – 12V DC Power Supply	TDK-Lambda Americas Inc Model: CPFE1000Fi-12 Serial #: 131222012006	2.0m, unshielded, 14 AWG, 3-wire
EUT – 28V DC Power Supply	TDK-Lambda Americas Inc Model: CPFE1000Fi-28 Serial #: 131222028005	2.0m, unshielded, 14 AWG, 3-wire
EUT – 48V DC Power Supply	TDK-Lambda Americas Inc Model: CPFE1000Fi-48 Serial #: 130322048008	2.0m, unshielded, 14 AWG, 3-wire
Support –Resistor Load	Model: N/A Serial: N/A	1.5m, unshielded, 10 AWG, 2-wire

### 2.2. Device Interconnection and I/O Cables

Connection	I/O Cable
EUT to Resistor Load	1.5m, unshielded, 10 AWG, 2-wire

### 2.3. Description and Method of Exercising the EUT

The CPFE1000Fi Series is a DC Power Supply, total 9 models in series. Its function is to output DC supply. The EUT was exercised by loading 1000W model 48 & 28 series, and 720W model 12 series. If the power input and output is disrupted as indicated by no output, or there is loss of functionality, may be considered a failure. The CPFE1000Fi Series has NO software & revision.

Description:

Input Voltage: 85-265VAC

Output Power: 1008W

Mechanical Size: approx. 114.3x42x254mm (WxHxL)  
 with another 2" added to height with external heatsink.

Models in series	Output voltage	Configuration
Model 1: CPFE1000Fi-12	12V DC	Chassis Base
Model 2: CPFE1000Fi-12/C	12V DC	Chassis base with cover
Model 3: CPFE1000Fi-12/P	12V DC	Without chassis
Model 4: CPFE1000Fi-28	28V DC	Chassis Base
Model 5: CPFE1000Fi-28/C	28V DC	Chassis base with cover
Model 6: CPFE1000Fi-28/P	28V DC	Without chassis
Model 7: CPFE1000Fi-48	48V DC	Chassis Base
Model 8: CPFE1000Fi-48/C	48V DC	Chassis base with cover
Model 9: CPFE1000Fi-48/P	48V DC	Without chassis

The EUT's performance during test was evaluated against the performance criterion specified by applicable test standards. Performance results are detailed in the test results section of this report.

### 2.4. Design Modifications for Compliance

**Device:** DC Power Supply

**Model:** CPFE1000Fi Series

The following design modifications were made to the EUT during testing.

None. No design modifications were made to the EUT during testing.

### 3. DESCRIPTION OF TEST SITE AND EQUIPMENT

#### 3.1. Description of Test Site

The test site is located at 2210 Faraday Ave., Suite 150, Carlsbad, CA 92008. Within the EMC facility there is a 10 meter semi-anechoic chamber and an area designated for future installation of a 3 meter semi-anechoic chamber. There are 3 general purpose EMC semi-anechoic chambers: two chambers are designed and built as MIL STD Emissions and Radiated Susceptibility chambers and one chamber has those characteristics with an additional capability to perform IEC/EN 61000-4-3 radiated susceptibility. Four test ground planes are located in the EMC area dedicated for: Conducted Emissions, EFT / Surge plane/ Conducted RF immunity, and a dedicated ESD test plane.

Radiated emissions measurements are performed in the 10 meter Semi-Anechoic chamber, which conforms to the volumetric normalized site attenuation (VNSA) for three and ten-meter measurements. The chamber also conforms to the SVSWR compliance requirements for 1-18 GHz measurements. The VNSA and SVSWR meet the technical requirements, as set, in the CISPR 16 and ANSI C63.4 documents. Facility test areas for conducted emissions and immunity testing also meet the construction and characteristics, as required by CISPR 16 and ANSI C63.4 documents.

Nemko’s EMC test facility is in compliance with all the current national and international requirements and is accredited by the US National Institute for Standards and Technology (NIST) National Voluntary laboratory Accreditation Program (NVLAP) under “Electromagnetic Compatibility and Telecommunications”. We have a large scope of accreditation which includes all necessary Commercial, Avionics and Military tests

Emissions measurements are performed using TILE software. Version 4.0.A.7 for radiated and version 3.4.K.24 for conducted.

#### 3.2. Facility Accreditation and Authorization

Nemko USA, Inc. is accredited through National Voluntary Laboratory Accreditation Program.

NVLAP LAB CODE 200116-0

## **4. DESCRIPTION OF TESTING METHODS**

### **4.1. Introduction**

Nemko USA, Inc. is accredited to ISO/IEC 17025 by the National Voluntary Laboratory Accreditation Program (NVLAP) for Electromagnetic Compatibility and Telecommunications testing. Part of the accreditation process involves the demonstration of competence in various test methods.

Prior to the beginning of work, Nemko personnel work with their clients to ensure the proper test standards and test methods are utilized. Applicable tests and the minimum criteria for a pass condition are listed in the administrative section of this report.

### **4.2. Test Methods**

The harmonized documents published for Information Technology Equipment are EN 55022: 2010+AC: 2011 for radio frequency emissions and EN 55024: 2010 for electromagnetic immunity. The methods employed to test the emissions and immunity characteristics of the Equipment Under Test are those mandated by the European Standards EN 55022 and EN 55024. The applicable tests and the minimum criteria for a pass condition that are listed in the administrative section of this report are taken from these standards.

### **4.3. Configuration and Methods of Measurements for Conducted Emissions**

This test measures the levels emanating from the EUT, thus evaluating the potential for the EUT to cause radio frequency interference to other electronic devices. Testing was performed in accordance with the test standard(s) referenced in the test summary section of this report. The Equipment Under Test (EUT) was configured based upon the requirements of the applicable test standard.

<b>DATE</b>	<b>DOCUMENT NAME</b>	<b>DOCUMENT #</b>	<b>PAGE</b>
July 19, 2013	TDK-Lambda Americas Inc - CPFE1000Fi Series - EMC Test Report	2013 07236803 EMC	19 of 97

#### 4.4. Configuration and Methods of Measurements for Radiated Emissions

This test measures the levels emanating from the EUT, thus evaluating the potential for the EUT to cause radio frequency interference to other electronic devices. Testing was performed in accordance with the test standard(s) referenced in the test summary section of this report. The Equipment Under Test (EUT) was configured based upon the requirements of the applicable test standard. Initial prescans for radiated emissions were performed as suggested per ANSI 63.22. The antenna is positioned at several heights while the EUT is rotated 360°. At each antenna height, the receiver scans and records the maximum emissions in the required frequency range as required by the applicable standards. From the recorded scans, a list of discrete frequencies is developed. To ensure that the maximum emission at each discrete frequency of interest is observed, the receive antenna is varied in height from one to four meters and rotated to produce horizontal and vertical polarities while the turntable is rotated to determine the worst emitting configuration. The numerical results are included herein to demonstrate compliance. The numerical results of the test are included herein to demonstrate compliance.

The numerical results that are applied to the emissions limits are arrived as demonstrated by the example below:

A	B	C	D	E	F	G	H	I
Measurement Frequency (MHz)	Meter Reading (dBµV)	Turn Table (degrees)	Antenna Height (cm)	Corrected Reading (dBµV/m)	Limit (dBµV/m)	Margin (dBµV/m)	Pass Fail	Comments

A. Frequency Measured in MHz.

B. Meter Reading: Emission Amplitude as measured with the antenna in dBµV, this is from the EMI receiver or Spectrum Analyzer.

C. Turn Table reading in degrees.

D. Antenna Height in centimeters.

E. Corrected Reading, the meter reading with the antenna factor, cable loss, attenuator loss, and preamplifier gain added in. This is the emission value to compare to the limit.

F. Limit from the specification.

G. Margin: difference in dB of Corrected Reading and Specification Limit, negative results indicate a margin value below the specification limit.

H. Pass Fail: Result; EUT does or does not comply at this frequency.

I. Comments. If any, the technician enters remarks special to the test performed.

#### 4.5. Device Performance Criteria for Immunity Tests

- **Criterion A** - The equipment shall continue to operate as intended without operator intervention. No degradation of performance or loss of function is allowed below a performance level specified by the manufacturer when the equipment is used as intended. The performance level may be replaced by a permissible loss of performance. If the minimum performance level or the permissible performance loss is not specified by the manufacturer, then either of these may be derived from the product description and documentation, and by what the user may reasonably expect from the equipment if used as intended.
- **Criterion B** - During the test, degradation of performance is allowed. However, no change of operating state or stored data is allowed to persist after the test. After the test, the equipment shall continue to operate as intended without operator intervention. The performance level may be replaced by a permissible loss of performance. If the manufacturer does not specify the minimal performance level (or the permissible performance loss), then either of these may be derived from the product description and documentation, or by what the user may reasonably expect from the equipment if used as intended.
- **Criterion C** - Loss of function is allowed, provided the function is self-recoverable, or can be restored by the operation of the controls by the user in accordance with the manufacturer's instructions. Functions, and/or information stored in non-volatile memory, or protected by a battery backup, shall not be lost.

For each test method, the test standard specifies the appropriate criterion to be met.

#### 4.6. Electrostatic Discharge Immunity: IEC 61000-4-2: 2008

This test simulates electrostatic events (similar to being “zapped” by touching a light switch) and evaluates the ability of the EUT to tolerate such events. Testing was performed in accordance with IEC 61000-4-2. Tabletop devices are placed on an insulated mat on a horizontal coupling plane. Air discharges and contact charges are made to the EUT on connectors and conducting surfaces (as illustrated in the Test Results section of this Test Report). The discharges shall be applied in two ways:

a) Contact Discharges to the conductive surfaces and to coupling planes:

The EUT shall be exposed to at least 200 discharges, 100 each at negative and positive polarity, at a minimum of four test points (a minimum of 50 discharges at each point). One of the test points shall be subjected to at least 50 indirect discharges (contact) to the center of the front edge of the horizontal-coupling plane. The remaining three test points shall each receive at least 50 direct contact discharges. If no direct contact test points are available, then at least 200 indirect discharges shall be applied in the indirect mode.

b) Air Discharge at slots and apertures, and insulating surfaces:

On those parts of the EUT where it is not possible to perform contact discharge testing, the equipment should be investigated to identify user accessible points where breakdown may occur. This investigation should be restricted to those areas normally handled by the user. A minimum of 10 single air discharges of each polarity and test level shall be applied to the selected test point for each area.

For further information, please refer to the technical sections in the IEC 61000-4-2 publication in addition to the test results section and photographs of the test set-up provided in this report.

#### 4.7. Radio Frequency Immunity: IEC 61000-4-3: 2006 A1:2007 +A2: 2010

This test bombards the EUT with electric fields that may couple into the system via chassis slots and interface cables and evaluates the product’s immunity. Testing was performed in accordance with IEC 61000-4-3. The RF immunity test entails subjecting the equipment under test to a uniform field of radiated electromagnetic energy of a specified field strength and frequency, and monitoring the functionality of the device as the frequency is swept over a specified frequency range.

The EUT is set up inside a shielded, semi-anechoic chamber with a radiating antenna at a distance of 3 meters from the EUT. The antennas used for radiating have a VSWR characteristic of 2:1 or better, Per CISPR16.

For further information, please refer to the technical sections in the IEC 61000-4-3 publication in addition to the test results section and photographs of the test set-up provided in this report.

#### 4.8. Electrical Fast Transient Immunity: IEC 61000-4-4: 2004+A1: 2010

This test injects a transient/burst interference onto the AC/DC power supply and signal I/O lines. Testing was performed in accordance with IEC 61000-4-4. The standard configuration for “type tests” outlined in IEC 61000-4-4 is used. For further information, please refer to the technical sections in the IEC 61000-4-4 in addition to the test results section and photographs of the test set-up provided in this report.

#### **4.9. Power Line Surge Immunity: IEC 61000-4-5: 2005**

This test simulates a lightning event by inducing transients onto the AC/DC power supply lines in common and differential mode. Testing was performed in accordance with IEC 61000-4-5.

Each device was tested in a total of three surge configurations:

**Surge #1:** Combination Wave, Line to Protective Earth with 9uF and 100Ohm, common mode, generator earthed.

**Surge #2:** Combination Wave, Neutral to Protective Earth with 9uF and 100Ohm, common mode, generator earthed.

**Surge #3:** Combination Wave, Line to Neutral with 18uF, differential mode, generator floated.

For further information, please refer to the technical sections in the IEC 61000-4-5 in addition to the test results section and photographs of the test set-up provided in this report.

#### **4.10. Radio Frequency Conducted Common Mode Immunity: IEC 61000-4-6: 2008**

This test injects a disturbance directly onto AC/DC power and signal I/O cables. Testing was performed in accordance with IEC 61000-4-6. The standard configuration as outlined in the IEC 61000-4-6 was used. For further information, please refer to the technical sections of the IEC 61000-4-6 publication in addition to the test results section and photographs of the test set-up provided in this report.

#### **4.11. Power Frequency Magnetic Field Immunity: IEC 61000-4-8: 2009**

This test subjects devices to the fields produced by current carrying conductors of standard building power. Testing was performed in accordance with IEC 61000-4-8. The standard configuration as outlined in IEC 61000-4-8 was used. For further information, please refer to the technical sections of IEC 61000-4-8 in addition to the test results section and photographs of the test set-up provided in this report.

#### **4.12. Voltage Dips and Short Interruptions: IEC 61000-4-11: 2004**

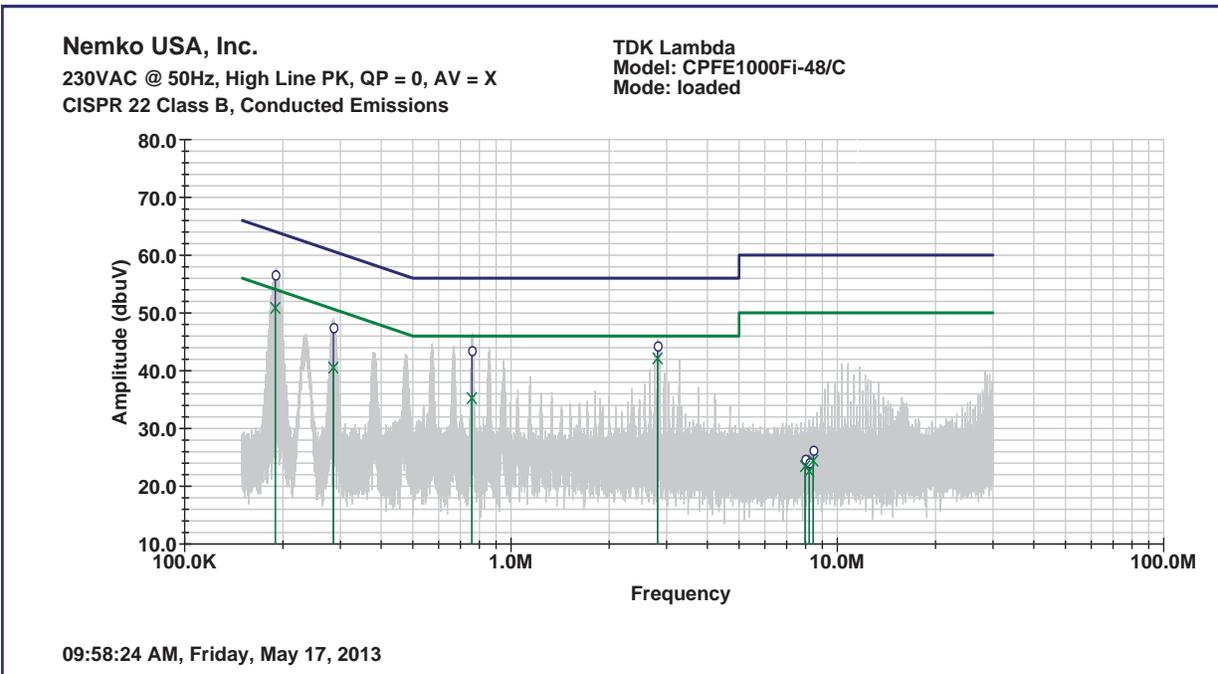

This test subjects the EUT to power network faults and “brownouts”. Testing was performed in accordance with IEC 61000-4-11. The standard configuration as outlined in the IEC 61000-4-11 was used. The EUT is powered up to a nominal voltage of 230 VAC 50 Hz, and then software-controlled voltage dips and interruptions are introduced. For further information, please refer to the technical sections of the IEC 61000-4-11 in addition to the test results section and photographs of the test set-up provided in this report.

## 5.2. Radiated Emissions Test Data

### 5.2.1. CPFE1000FI-12

## Radiated Emissions Tabular Data

Horizontal RE Data								
Measurement Frequency (MHz)	QP Measured (dBμV)	Adjustments (dBm)	Turn Table (degrees)	Antenna Height (cm)	Corrected Reading (dBμV/m)	Limit (dBμV/m)	Margin (dBμV/m)	Pass Fail
74.86	39.7	-22.1	7	110	17.5	40.0	-22.5	Pass
81.81	38.7	-22.3	261	110	16.4	40.0	-23.6	Pass
87.28	28.3	-21.9	353	110	6.4	40.0	-33.6	Pass
673.43	23.3	-6.2	0	110	17.1	47.0	-29.9	Pass
856.20	22.8	-3.1	3	110	19.7	47.0	-27.3	Pass
898.58	22.4	-3.8	3	110	18.6	47.0	-28.4	Pass

Vertical RE Data								
Measurement Frequency (MHz)	QP Measured (dBμV)	Adjustments (dBm)	Turn Table (degrees)	Antenna Height (cm)	Corrected Reading (dBμV/m)	Limit (dBμV/m)	Margin (dBμV/m)	Pass Fail
71.02	49.0	-22.0	167	110	27.0	40.0	-13.0	Pass
73.08	43.6	-22.1	7	110	21.6	40.0	-18.4	Pass
74.38	49.0	-22.1	173	110	26.8	40.0	-13.2	Pass
278.21	29.7	-15.9	3	110	13.8	47.0	-33.2	Pass
476.54	28.2	-10.8	63	110	17.4	47.0	-29.6	Pass
955.91	22.0	-1.6	7	110	20.4	47.0	-26.6	Pass

Calculation:

Meter Reading + antenna factor + cable loss – preamplifier = Corrected Reading

(Antenna factor, cable loss, preamplifier values are not listed.)

Corrected Reading – Spec. Limit = Margin

Negative Margin indicates passing emissions.

Meter Readings are Quasi-Peak maximum hold for turntable direction and antenna height.

503.31	32.1	-9.7	349	113	22.4	47.0	-24.6	Pass

Calculation:

Meter Reading + antenna factor + cable loss – preamplifier = Corrected Reading

(Antenna factor, cable loss, preamplifier values are not listed.)

Corrected Reading – Spec. Limit = Margin

Negative Margin indicates passing emissions.

Meter Readings are Quasi-Peak maximum hold for turntable direction and antenna height.

## APPENDIX A

### A. Radiated Emissions Measurement Uncertainties

#### 1. Introduction

ISO/IEC 17025:2005 and ANSI/NCSL Z540.3: 2006 require that all measurements contained in a test report be “traceable”. “Traceability” is defined in the International Vocabulary of Basic and General Terms in Metrology (ISO: 1993) as: “the property of the result of a measurement... whereby it can be related to stated references, usually national or international standards, through an unbroken chain of comparisons, all having stated uncertainties”.

The purposes of this Appendix are to “state the Measurement Uncertainties” of the conducted emissions and radiated emissions measurements contained in Section 5 of this Test Report, and to provide a practical explanation of the meaning of these measurement uncertainties.

#### 2. Statement of the Worst-Case Measurement Uncertainties for the Conducted and Radiated Emissions Measurements Contained in This Test Report

**Table 1: Worst-Case Expanded Uncertainty "U" of Measurement for a k=2 Coverage Factor**

Conducted and Radiated Emissions Measurement Detection Systems	Applicable Frequency Range	"U" for a k=2 Coverage Factor
Spectrum Analyzer and LISN	100 kHz – 30 MHz	+/-2.8 dB
Spectrum Analyzer and Telecom ISN	100 kHz – 30 MHz	+/-1.38dB
Spectrum Analyzer, Pre-amp, and Antenna	30 MHz-200 MHz	+/-3.9 dB
Spectrum Analyzer, Pre-amp, and Antenna	200 MHz-1000 MHz	+/- 3.5 dB
Spectrum Analyzer, Pre-amp, and Antenna	1 GHz - 18 GHz	+/-2.6 dB

NOTES:

1. Applies to 3 and 10 meter measurement distances
2. Applies to all valid combinations of Transducers (i.e. LISNs, Line Voltage Probes, and Antennas, as appropriate)
3. Excludes the Repeatability of the EUT

## Nemko USA, Inc.

2210 Faraday Ave, Suite 150  
Carlsbad, CA 92008  
Phone (760) 444-3500 Fax (760) 444-3005

### 3. Practical Explanation of the Meaning of Radiated Emissions Measurement Uncertainties

In general, a “Statement of Measurement Uncertainty” means that with a certain (specified) confidence level, the “true” value of a measurand will be between a (stated) upper bound and a (stated) lower bound.

In the specific case of EMC Measurements in this test report, the measurement uncertainties of the conducted emissions measurements and the radiated emissions measurements have been calculated in accordance with the method detailed in the following documents:

- o ANSI Z540.2 (2002) Guide to the Expression of Uncertainty in Measurement
- o NIS 81:1994, The Treatment of Uncertainty in EMC Measurements (NAMAS, 1994)
- o NIST Technical Note 1297(1994), Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results (NIST, 1994)

The calculation method used in these documents requires that the stated uncertainty of the measurements be expressed as an “expanded uncertainty”,  $U$ , with a  $k=2$  coverage factor. The practical interpretation of this method of expressing measurement uncertainty is shown in the following example:

EXAMPLE: Assume that at 39.51 MHz, the (measured) radiated emissions level was equal to +26.5 dBuV/m, and that the +/- 2 standard deviations (i.e. 95% confidence level) measurement uncertainty was +/- 3.4 dB.

## APPENDIX B

### B. Nemko USA, Inc. Test Equipment & Facilities Calibration Program

Nemko USA, Inc. operates a comprehensive Periodic Calibration Program in order to ensure the validity of all test data. Nemko USA's Periodic Calibration Program is fully compliant to the requirements of NVLAP Policy Guide PG-1-1988, ANSI/NCSL Z540.3: 2006, ISO 10012:2003, ISO/IEC 17025:2005, and ISO-9000: 2000. Nemko USA, Inc.'s calibrations program therefore meets or exceeds the US national commercial and military requirements [N.B. ANSI/NCSL Z540-1-1994 replaced MIL-STD-45662A].

Specifically, all of Nemko USA's primary reference standard devices (e.g. vector voltmeters, multimeters, attenuators and terminations, RF power meters and their detector heads, oscilloscope mainframes and plug-ins, spectrum analyzers, RF preselectors, quasi-peak adapters, interference analyzers, impulse generators, signal generators and pulse/function generators, field-strength meters and their detector heads, etc.) and certain secondary standard devices (e.g. RF Preamplifiers used in CISPR 11/22 and FCC Part 15/18 tests) are periodically recalibrated by:

- A Nemko USA-approved independent (third party) metrology laboratory that uses NIST-traceable standards and that is ISO Guide 25-accredited as a calibration laboratories by NIST; or,
- A Nemko USA-approved independent (third party) metrology laboratory that uses NIST-traceable standards and that is ISO Guide 25-accredited as a calibration laboratory by another accreditation body (such as A2LA) that is mutually recognized by NIST; or,
- A manufacturer of Measurement and Test Equipment (M&TE), if the manufacturer uses NIST-traceable standards and is ISO Guide 25-accredited as calibration laboratory either by NIST or by another accreditation body (such as A2LA) that is mutually recognized by NIST; or
- A manufacturer of M&TE (or by a Nemko USA-approved independent third party metrology laboratory) that is not ISO Guide 25-accredited. (In these cases, Nemko USA conducts an annual audit of the manufacturer or metrology laboratory for the purposes of proving traceability to NIST, ensuring that adequate and repeatable calibration procedures are being applied, and verifying conformity with the other requirements of ISO Guide 25).

DATE	DOCUMENT NAME	DOCUMENT #	PAGE
July 19, 2013	TDK-Lambda Americas Inc - CPFE1000Fi Series - EMC Test Report	2013 07236803 EMC	96 of 97

**Nemko USA, Inc.**

2210 Faraday Ave, Suite 150  
Carlsbad, CA 92008  
Phone (760) 444-3500 Fax (760) 444-3005

In all cases, the entity performing the Calibration is required to furnish Nemko USA with a calibration test report and/or certificate of calibration, and a “calibration sticker” on each item of M&TE that is successfully calibrated.

Calibration intervals are normally one year, except when the manufacture advises a shorter interval or if US Government directives or client requirements demand a shorter interval. Items of instrumentation/related equipment which fail during routine use, or which suffer visible mechanical damage (during use or while in transit), are sidelined pending repair and recalibration.(Repairs are carried out either in-house [if minor] or by a Nemko USA-approved independent [third party] metrology laboratory, or by the manufacturer of the item of M&TE).

Each antenna used for CISPR 11, CISPR 14, CISPR 22, and FCC Part 15 and Part 18 radiated emissions testing (and for testing to the equivalent European Norms) is calibrated annually by either a NIST (or A2LA) ISO Standard 17025-Accredited third-party Antenna Calibration Laboratory or by the antenna’s OEM if the OEM is NIST or A2LA ISO Standard 17025-accredited as an antenna calibration laboratory. The antenna calibrations are performed using the methods specified in CISPR 16-1-4 or ANSI C63.5-2006, including the “Three-Antenna Method”. Certain other kinds of antennas (e.g. magnetic-shielded loop antennas) are calibrated annually by either a NIST (or A2LA) ISO Standard 17025-accredited third-party antenna calibration laboratory, or by the antenna’s OEM if the OEM is NIST or A2LA ISO Standard 17025-accredited as an antenna calibration laboratory using the procedures specified in the latest version of SAE ARP-958.

In accordance with FCC and other regulations, Nemko USA recalibrates its suite of antennas used for radiated emissions tests on an annual basis. These calibrations are performed as a precursor to the FCC-required annual revalidation of the Normalized Site Attenuation properties of Nemko USA’s 10-meter Semi-Anechoic chamber. Nemko USA, Inc. uses the procedures given in CISPR 16-1-4 and, ANSI C63.4-2009 when performing the normalized site attenuation measurements.
