TDK·Lambda

PXC-M03xxW Dual Output Series: DC-DC Converter Module

9 ~ 36 VDC and 18~ 75 VDC input; ±5 to ±15 VDC Dual Output
3 Watts Output Power

FEATURES

- DUAL OUTPUT UP TO ±300mA
- REINFORCED INSULATION FOR 250VAC WORKING VOLTAGE
- CLEARANCE AND CREEPAGE DISTANCE :8.0mm/2MOPP
- 5000VAC INPUT TO OUTPUT 2MOPP ISOLATION
- NO MINIMUM LOAD REQUIRED
- HIGH EFFICIENCY UP TO 87%
- BUILT-IN EMI CLASS A FILTER
- 2μA PATIENT LEAKAGE CURRENT
- SMALL SIZE: 1.25×0.80×0.41 INCH
- 4:1 ULTRA WIDE INPUT VOLTAGE RANGE
- FIXED SWITCHING FREQUENCY
- INPUT UNDER-VOLTAGE PROTECTION
- OUTPUT OVER-VOLTAGE PROTECTION
- OVER-CURRENT PROTECTION
- OUTPUT SHORT CIRCUIT PROTECTION
- REMOTE ON/OFF
- COMPLIANT TO RoHS 10 & REACH

CE and UKCA MARKED
SAFETY APPROVALS: ANSI/AAMI ES60601-1
EN60601-1
IEC60601-1

APPLICATIONS

- MEDICAL EQUIPMENT
- TELECOM/DATACOM
- INDUSTRY CONTROL SYSTEM
- MEASUREMENT EQUIPMENT
- SEMICONDUCTOR EQUIPMENT
- PV POWER SYSTEM
- IGBT GATE DRIVER

OPTIONS

- PIN CONNECTION
- REMOTE ON/OFF
- TRIM

GENERAL DESCRIPTIONS

The PXC-M03W series offer 3 watts of output power from a 1.25 x 0.80 x 0.41 inch package. PXC-M03W series have 4:1 wide input voltage of 9~36VDC and 18~75VDC. The PXC-M03W has features 5000VAC of isolation, short circuit protection, over-current protection and over-voltage protection. All models are particularly suited to IGBT isolated power supplies, measurement equipment, telecommunications, industry and medical equipment applications.

Output Voltage Adjustment

Output voltage adjustment is an optional function for PXC-M03-xxWDxx-xT.

It allows the user to increase or decrease the output voltage of the module. This is accomplished by connecting an external resistor between the TRIM pin and either the +Vout or -Vout pins. With an external resistor between the TRIM and -OUTPUT pin, the output voltage increases. With an external resistor between the TRIM and +OUTPUT pin, the output voltage decreases. The external TRIM resistor needs to be at least 1/16W of rated power.

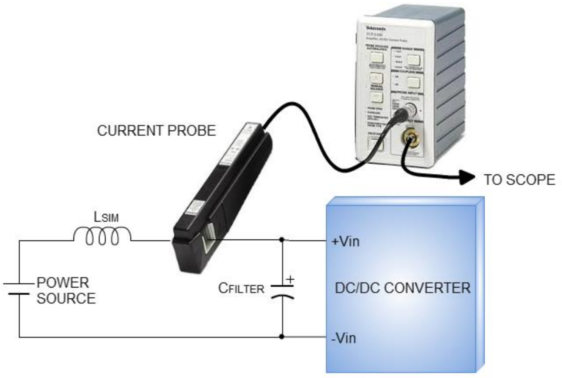
Input Source Impedance

The power module should be connected to a low impedance input source. Highly inductive source impedance can affect the stability of the power module. Install choke (L_{SIM}) to simulate the impedance of power source. External input capacitors C_{FILTER} serve primarily as energy-storage elements, minimizing line voltage variations caused by transient IR drops in conductors from backplane to the DC/DC. The capacitor must as close as possible to the input terminals of the power module for lower impedance. The input reflected-ripple current measurement configuration is shown below:

Input reflected-ripple current measurement setup



PXC-M03-24WDxx

Component	Value	Voltage	Reference
L_{SIM}	12μH	----	Inductor
C_{FILTER}	47μF	100V	Nippon chemi-con KY-series

PXC-M03-48WDxx

Component	Value	Voltage	Reference
L_{SIM}	12μH	----	Inductor
C_{FILTER}	47μF	100V	Nippon chemi-con KY-series

Output Over Current Protection

When excessive output currents occur in the system, circuit protection is required on all power supplies. Normally, overload current is maintained at approximately 150 percent of rated current for PXC-M03W SERIES.
Hiccup-mode is a method of operation in a power supply whose purpose is to protect the power supply from being damaged during an over-current fault condition. It also enables the power supply to restart when the fault is removed. There are other ways of protecting the power supply when it is over-loaded, such as the maximum current limiting or current fold-back methods.

One of the problems resulting from over current is that excessive heat may be generated in power devices; especially MOSFET and Schottky diodes and the temperature of those devices may exceed their specified limits. A protection mechanism has to be used to prevent those power devices from being damaged.

The operation of hiccup is as follows. When the current sense circuit sees an over-current event, the controller shuts off the power supply for a given time and then tries to start up the power supply again. If the over-load condition has been removed, the power supply will start up and operate normally; otherwise, the controller will see another over-current event and shut off the power supply again, repeating the previous cycle. Hiccup operation has none of the drawbacks of the other two protection methods, although its circuit is more complicated because it requires a timing circuit. The excess heat due to overload lasts for only a short duration in the hiccup cycle, hence the junction temperature of the power devices is much lower.

The hiccup operation can be done in various ways. For example, one can start hiccup operation any time an over-current event is detected; or prohibit hiccup during a designated start-up is usually larger than during normal operation and it is easier for an over-current event is detected; or prohibit hiccup during a designated start-up interval (usually a few milliseconds). The reason for the latter operation is that during start-up, the power supply needs to provide extra current to charge up the output capacitor. Thus the current demand during start-up is usually larger than during normal operation and it is easier for an over-current event to occur. If the power supply starts to hiccup once there is an over-current, it might never start up successfully. Hiccup mode protection will give the best protection for a power supply against over current situations, since it will limit the average current to the load at a low level, so reducing power dissipation and case temperature in the power devices.

Output Short Circuitry Protection

Continuous and auto-recovery mode.

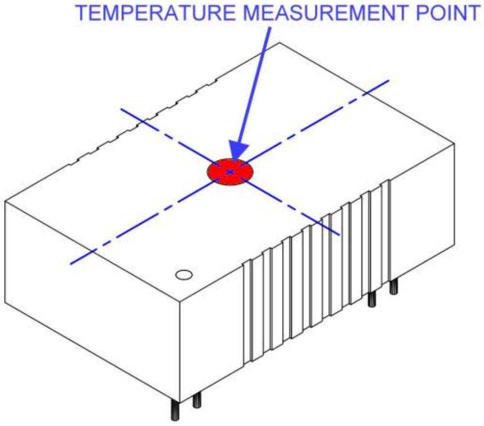
During short circuit, converter still shut down. The average current during this condition will be very low and the device can be safe in this condition.

Output Over Voltage Protection

The output over-voltage protection consists of circuitry that internally clamps the output voltage. If a more accurate output over-voltage protection scheme is required then this should be implemented externally via use of the remote on/off pin.

Thermal Considerations

The power module operates in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat is removed by conduction, convection, and radiation to the surrounding environment. Proper cooling can be verified by measuring the point as shown in the figure below. The temperature at this location should not exceed 105℃. When operating, adequate cooling must be provided to maintain the test point temperature at or below 105℃. Although the maximum point temperature of the power modules is 105℃, limiting this temperature to a lower value enhances the reliability.

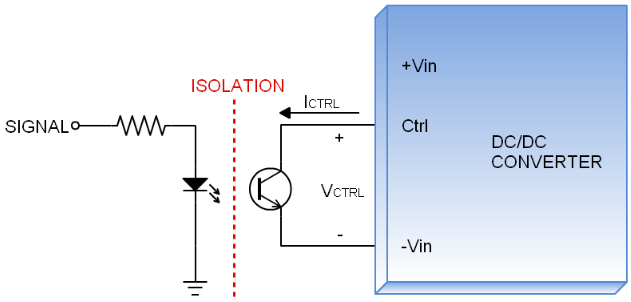


Remote On/Off Control

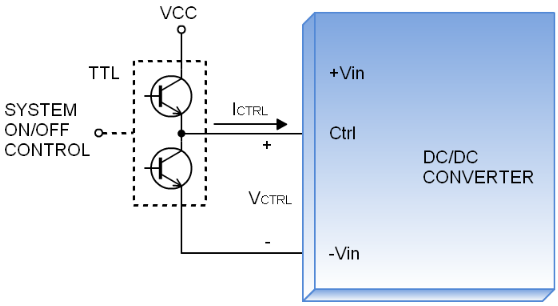
Only for B-type pin connection option with suffix -P,. Ex.: PXC-M03-24WD05-P

The module is ON during logic Low and turns OFF during logic High. The Ctrl pin is an open collector/drain logic input signal that is referenced to (-)Vin. If not using the remote on/off feature, the Ctrl and (-)Vin pins should be connected together (shorted) or apply 0-1.2V between these two pins for the module to be ON.

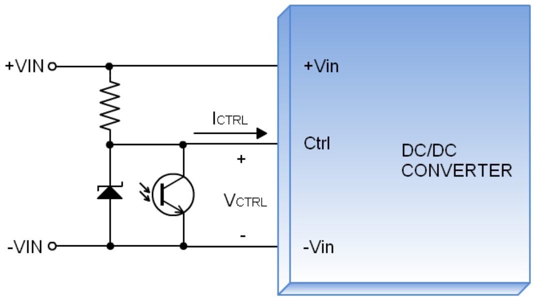
Remote ON/OFF Implementation



Isolated-Control Remote ON/OFF



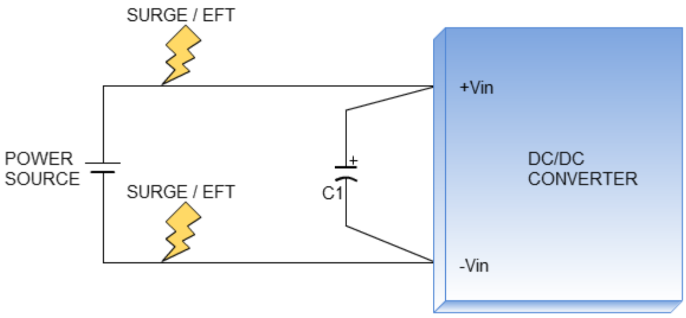
Level Control Using TTL Output



Level Control Using Line Voltage

EMS Considerations

The PXC-M03W series can meet Fast Transient EN61000-4-4 and Surge EN61000-4-5 performance criteria A with external components connected to the input terminals of the module. Please see the following schematic:



Surge / Fast Transient

Safety and Installation Instructions

Fusing Consideration

Caution: This power module is not internally fused. An input line fuse must always be used.

This encapsulated power module can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of sophisticated power architecture. For maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. See suggested values below：

Model	Fuse Rating (A)	Fuse Type
PXC-M03-24WDxx	0.63	Slow-Blow
PXC-M03-48WDxx	0.315	Slow-Blow

Based on the information provided in this data sheet on inrush energy and maximum dc input current at low Vin.

MTBF and Reliability

The MTBF has been calculated using:
MIL-HDBK 217F NOTICE2 FULL LOAD, Operating Temperature at 25℃. The resulting figure for MTBF is 6.444×10^{6} hours.
